Impact of Sleep Deprivation on Students' Productivity

Problem

Sleep plays a critical role in cognitive function, memory retention, and overall well-being. However, university students often experience **irregular sleep patterns and sleep deprivation** due to academic workload, social activities, and screen time. This lack of sufficient rest may negatively impact **productivity, concentration, and academic performance**. Many students struggle with balancing sleep and academic responsibilities. While some students sacrifice sleep to study longer, it is unclear whether **less sleep leads to better performance or if it actually reduces productivity**. The relationship between **sleep deprivation and productivity** has not been quantitatively analyzed in the student population, leaving students without data-driven insights to optimize their schedules.

Attributes of data needed

Sleep hours today, Caffeine intakes today, physical activity for today, stress levels today, screen time for fun, screen time for study, **Productivity Score(predict)**

Data Cleaning & Preprocessing

Before applying machine learning models, the dataset needs to be cleaned and structured properly. This will be done using Excel’s built-in features such as:

- Removing Duplicates
- Handling Missing Values
- Standardizing Data

Applying Machine Learning Models
